

.SHELL. .SPOOFER.TUTORIAL.

Read the full tutorial carefully, before downloading/running the Spoofer.

1. Spoofer Requirements
2. How to install/setup
3. FAQ & Troubleshooting guide

1. SPOOFER REQUIREMENTS

- Uninstall any antivirus software from your PC before downloading the spoofer
- Turn off Windows Defender before downloading the spoofer ([Defender Control download](#))
- You need to run one of our supported [Windows builds](#) (1903, 1909, 2004 or 2009/20H2)
- Make sure that the [latest Visual Studio version](#) is installed on your PC
- Make sure that Vanguard and FACEIT are NOT installed on your PC
- Make sure that your drivers are up to date on your PC (GPU, BIOS etc.)
- “Virtualization” has to be **disabled** in BIOS ([Tutorial video](#) - The video shows how to turn it on but you have to turn it OFF) otherwise the loader will not open
- [AHCI has to be enabled](#) in your BIOS. This setting is usually enabled by default
- “[Fast boot](#)” has to be disabled to avoid trouble with reverting back certain hardware IDs
- Your [Microsoft redistributables x64 pack](#) needs to be up to date (Installer linked in post)
- Spoofer needs to be downloaded and ran from your Windows drive and not from an USB

Disclaimer before you get started:

Spoofers don't get detected but they can become outdated because of anti cheats changing their HWID ban mechanics. If there was a “big” game update please check our Discord server for announcements. We frequently update to counter such updates and this can cause downtimes of the spoofer. These updates are necessary to keep you guys undetected in the games you play. You'll find the invite to our Discord server in your purchase email for the most recent announcements/news.

Scroll down.

2. HOW TO INSTALL/SETUP

- Make sure that you meet all of the requirements listed above
- Download the latest spoofer build from your purchase email or from our Discord server
- Have the spoofer downloaded to your Windows drive, placed in a new folder
- Now start the spoofer (our spoofer .exe has a random name to prevent blacklisting)
- The login/registration window will now pop up (screenshot below)

- Once you register, write your login information down on your phone or on paper. We don't provide lost login data and you won't be able to register a new account on that PC if you lose them. Your account information is YOUR responsibility
- Finish the registration by entering a unique username, a password with no special characters and your email address

Once again:

Lost login information won't be provided. Write them down on phone or on paper.

Scroll down.

➡ Now login using the information you just registered with

A screenshot of a login window titled "09C8C75". It contains two input fields: "Username" with the placeholder text "Your Username" and "Password" with the placeholder text "Your password". Below these fields are two buttons: "Login" and "Registration". A red box highlights the "Login" button, and three red arrows point to the "Username", "Password", and "Login" fields respectively. The version "Ver: 8.2.9" is displayed in the bottom right corner.

➡ After successful login you will need to enter your key to activate your spoofer. You received your product key via email. Make sure to copy paste the key correctly without any space or missing a number

A screenshot of an activation window titled "0DAD235". It contains two labels: "Status:" and "Expiration:", each followed by a text box. Below these is a text box with the placeholder text "* Enter Your Key Here *". At the bottom are two buttons: "Inject" and "ActivateKey". A red arrow points to the "Enter Your Key Here" text box, and another red arrow points down to the "ActivateKey" button, which is highlighted with a red box.

➡ Once you entered your key and pressed "ActivateKey" you will very likely get a pop up saying "**Activation Fail**". Ignore this message, since it's just a database ping-bac. **Your key got successfully registered anyway.**

➡ After you entered your key you simply close the loader and start it again

Scroll down.

➤ Now, after you logged in again, multiple spoofer options should show up on the left in your loader window as on the screenshot below. You now never enter your key again.

➤ The options marked red might have a different name for you depending on the loader build you received. If the left side on the loader is blank, check if you entered your key correctly and restart the loader until the spoofer options show up on the left side of the loader

➤ If you see the spoofer options on the left side of the loader you activated the product successfully. You don't ever enter your key afterwards again. If you do, this can cause problems with your subscription.

➤ Now physically click on "Spoofer" and click on "Inject" afterwards. This will start the spoofing process. Once the spoofing process is done you close the loader/window

Spoofers option supports all listed games on the product page.

Scroll down.

➡ After running the spoofer the first time on your PC it will most likely tell you to restart your PC. This is necessary to install our kernel driver. Restart your PC if the spoofer tells you to

➡ Explaining the different spoofing options shown in your loader:

➡ **"Spoofers"** is the regular spoofer which you should use. It spoofs all necessary hardware IDs, network adapters and cleans up tracking files. Restarting your PC will revert most of the changes done. You will need to run the spoofer after every PC restart before playing

➡ **"Spoofers-Static"** spoofs to a certain set of hwids and sticks to it (if you wanna play clean and just avoid your first hwid ban). You will have to spoof with Spoofers-static after every PC restart before playing. We generally don't recommend this option but to use the normal "Spoofers" option from the loader

➡ **"Spoofers-Test"** is for admin purpose only. Only ever use this option if an admin told you to

➡ If you want to check if the spoofer is working properly please run the "SerialChecker.exe" which can be found in our Discord server (channel #spoofer-tutorial). Restart your PC, run the SerialChecker.exe and screenshot the results. Now run the spoofer and the SerialChecker.exe again. Compare the changes to your first screenshot made. If NONE of the serials changed, please jump back to the requirements page at the beginning of this tutorial. If only certain hardware IDs changed then you are good to play. The spoofer will always only spoof what's necessary

➡ After you successfully spoofed (spoofer will tell you in a pop up message) then you are good to start playing. If this is the first time running the spoofer on your PC you will need a new game account which you have never logged in before. A spoofer can't unban accounts. Close the spoofer/loader window after you successfully spoofed

➡ Done

Note:

If you are using any kind of cheats/hacks/scripts and those get detected, your game account will be banned anyway even if you used a spoofer. The spoofer bypasses your hardware ID ban but doesn't make your account invincible to cheat detections. If you wanna be sure: play legit without cheats. Spoof again after every PC restart before you start gaming. Don't spoof multiple times on the same PC session!

Scroll down.

3. FAQ & TROUBLESHOOTING

Read the FAQ & Troubleshooting guide BEFORE opening up a support ticket. We won't answer questions which are answered in this tutorial to save your and our own time.

➡ **I get "Activation Fail" when I enter my key**

Read the tutorial again. You either copy paste the key incorrectly, the key has ran out or the key got registered and you only need to restart the loader for your sub to show up

➡ **My loader just closes after I press "Login"**

This happens if our server is down, an update is being applied or the service as a whole is under maintenance. Just wait for it to be back up. We usually announce that in our Discord server

➡ **Loader doesn't open at all but only changes the .exe name**

Read the tutorial again. You are not meeting our listed requirements. Especially check for the virtualization part in the requirements.

➡ **I get "Bad HWID" message when trying to login**

This message comes up when you either reinstalled Windows, used another spoofer, a cheat with an integrated spoofer or when you changed hardware in your PC. Open up a support ticket and provide your username (correct spelling, correct lower- and uppercase letters), your key and ask for a "hardware ID reset"

➡ **How can I check if my serials changed correctly?**

Read the tutorial again and find our SerialChecker.exe in our Discord server.

➡ **I get "VCRUNTIME.DLL" error when starting the loader**

Read the tutorial again. Especially the requirements part about the "Microsoft redistributables x64 pack"

➡ **Do I need to run a VPN additionally to the spoofer?**

Please check on our Discord server in #spoofer-status if your game requires to run a VPN along with the spoofer, to bypass your hwid ban

➡ **My cheat doesn't recognize me as user anymore**

If you want to cheat, make sure to start your cheat before using the spoofer. Ask your cheat provider to get a hardware ID reset on their product, if you can't login to your cheat. Beside that: We are not responsible for your cheat to work, we are responsible to bypass your hardware ID ban. If your cheat provider tracks hardware IDs which need to be spoofed to bypass your hardware ID ban, then you should probably change the cheat provider.

Scroll down!

➡ **I get “VCRUNTIME.DLL” error when starting the loader**

Read the tutorial again. Especially the requirements part about the “Microsoft redistributables x64 pack”

➡ **I get a “Spoof failed” message**

That either happens because you are not meeting the requirements or because an update is currently being applied to the server

➡ **I got banned while being spoofed due to a detected cheat, what now?**

No need to worry. Since you are spoofing after every PC restart and getting a new set of hwids each time you do so, you can simply spoof and get back in the game with a new game account

➡ **I got banned only using the spoofer and NO cheat/script/hack, what now?**

We take ban reports seriously. However, we only do so if the following things were checked by the user: Did I maybe have a cheat or cheat driver still on my PC, even if I didn't run it? Did I actually spoof on this PC session or did I maybe forget to spoof before starting to play? Did I maybe accidentally spoofed twice on the same PC session? Am I not meeting one of the spoofer requirements? Did I maybe forget to check if my serials were changing correctly with the serial checker.exe?

If you can answer one or more of these questions with “Yes”, then you should try again with checking all of the things mentioned above.

If you can honestly answer all of these questions with “No”, then please report the ban via support ticket on our Discord server. Mentioning your windows build, the game you got banned on, how fast you got banned after starting to play and your username. We will then look into your ban report and update if necessary.

Just to clarify: We won't ever investigate a ban report where a cheat was used. Even if your cheat provider claims to be the *super-duper-undetected-1337-hack-machine* ..We don't care. We are only responsible for our spoofer and therefore only investigate ban reports where NO cheat was used. Cheat providers like to blame the ban on you or other providers to keep their sales running even if the cheat or certain user builds are detected.

➡ **I got a bluescreen after clicking on “Inject” in the loader**

Read the requirements of this tutorial carefully again. If you are running a VPN try spoofing without that VPN. If the bluescreen problem remains, unplug all USB hard drives connected to your PC (external ones). If problem remains, open up a support ticket with your PC specs, windows build and username

➡ **None of my serials changed, I checked with SerialChecker.exe**

Read the requirements of this tutorial carefully again.

Scroll down!

➡ **Why is the spoofer not changing my XXX serial?**

We all love myths sometimes and reading stuff on the internet. But as your Mum might have already told you: Not everything you read on 1337-hacking forums is actually true. Please don't bother messaging us asking about why we don't spoof your [Insert random serial here] and why you think that's totally necessary. We are experts on our field. We spoof what's needed to be spoofed. Nothing more.

➡ **I lost my login details despite I was told to write them down. I am stupid.**

Yes. You are. Looking up personal info on a foreign server is against the privacy law in the country where we operate. It's therefore a criminal offense doing so. If there is no way for you that you remember/find your login info, then we will take a fee of 50 USD to look them up, as compensation. Tutorial told you twice that you should save them somewhere where you don't lose them. If you are fine with paying the fee, open up a support ticket and explain your issue.

➡ **Is the spoofer safe to use right now?**

The spoofer supports the games listed on the product page. You can also find the live status for each game on our Discord server. You won't get any other info than that from admins.

➡ **Is the spoofer safe to use in a game which is NOT listed on the product page?**

We don't know. We can't and won't test the spoofer in all games on this planet. However, since we are faking all crucial and most common hardware IDs there is a chance that you can also bypass a hwid ban on a game which we don't officially support. We recommend doing a full windows wipe and reinstall before testing that. We don't take over any responsibility for a ban in a game we don't officially support.

➡ **Where can I renew my subscription once my key ran out?**

On our [website](#). Each key only ever starts being active once it gets activated in the loader. Which means you could technically buy multiple keys (if we got a discount running for example) and save them for later.

➡ **Can I use the spoofer on multiple PCs?**

Our spoofer is hardware ID locked to the PC you activated it on. If you want to use the spoofer on a different PC you will need to buy another key and register a new account on that PC.

➡ **Can I sell or gift my subscription to someone else?**

No. We don't do sub transfers to prevent leaks and abuse.

Scroll down!

➤ **I bought an subscription and now wanna “upgrade” to a higher subscription. Can you gift me the price difference?**

No. Buying a specific sub was your personal choice. Our prices are reasonable. We don't do “upgrade” deals.

➤ **Is there any discounts running at the moment or can you give me a discount?**

If there is a special discount running then it will be announced on our Discord server. Please don't ask for a discount if no special deal is running. Our prices mirror the quality we provide.

➤ **Can you make the spoofer work for game XXX?**

While we appreciate suggestions we will not start supporting a game upon user requests. If we add a newly supported game we will announce that on our Discord server and the website.

➤ **Can you code me something personally? A hack for example?**

No. We are busy with our own projects and don't do freelance coding. Please don't ask.

***YAY* You finished the tutorial.**

Thanks for being a responsible user and taking the time.

You got questions which aren't answered in this tutorial? Open a ticket on Discord.

You can find our latest Discord information on the <https://shellsoftware.net/> front page.

Please check first if your issue is listed in this tutorial since our support staff won't answer questions which are covered in this guide. Thanks for understanding!
